

Student A: Customer

Your company is building a big new factory and you need to install a good lighting system. You need 100 lamps to light the area. You will meet a representative of a company that supplies lighting equipment. Prepare your role carefully before you start.

Do some relationship-building, then ask about:

- the supplier's product range
- prices and discounts (another supplier has quoted you £200 per lamp)
- terms of payment
- guarantees and maintenance
- delivery and installation time (the lighting will be needed in about 3 months)
- if they will accept a penalty clause for late installation

**Student B: Supplier**

You work for a company that makes high-quality industrial and commercial lamps. You have ISO 9000 (the international guarantee of quality). Your lamps can be found on highways in Finland and in boutiques in Paris and Buenos Aires. You will meet with a potential customer who wants new lamps. Prepare your role carefully before you start.

You have two products to sell:

	<u>Standard model</u>	<u>New model</u>
Special features	—	energy-efficient / longer life
List price (per lamp)	£200	£300
Guarantee	two years	four years

For both models of lamp:

Quantity discount	Negotiable.
Terms of payment	Negotiable, but you expect a good percentage in advance.
Guarantee	See above, and it includes a free inspection every year. Guarantee is renewable for a small cost.
Delivery	3 months (your factory is very busy at the moment).
Installation	This takes another one month after delivery.
Penalty	It is not company policy to have a penalty for late delivery/installation.

Lighting design service. This customer wants a simple internal lighting system. You also offer a lighting design service for the inside and outside of the factory and offices using advanced computer software. Modern lighting design will improve the image of any company. A visit by one of your consultants costs £4,000. The consultant produces a report.
